Aviation environmental impacts and mitigation / adaptation levers

lundi 18 mai 2026 10:50 (35 minutes)

Aviation contributes to climate change through its CO₂ emissions and other effects known as non-CO₂ effects. This course will quickly describe these effects, as well as other environmental impacts such as land use or energy resources consumptions. A classification of mitigation levers to reduce these impacts will then be proposed. Finally, the concepts of physical and transition risks will be introduced to discuss adaptation levers.

Orateur: PLANES, Thomas
